CASTABILITY	B	DECORATIVE ANODIZING	D
RESISTANCE TO HOT TEARING	B	ABILITY TO BE WELDED	C
PRESSURE TIGHTNESS	B	ABILITY TO BE POLISHED	B
MACHINABILITY (after cast)	B	STRENGTH AT ROOM TEMPERATURE	D
MACHINABILITY (after heat treatment)	-	STRENGTH AT ELEVATED TEMPERATURE (200°C)	A
RESISTANCE TO CORROSION	D	DUCTILITY	C

A: EXCELLENT, B: GOOD, C: FAIR, D: POOR, E: NOT RECOMMENDED, F: UNSUITABLE

GUIDELINES FOR USE

The ingot re-melting process must be carried out as fast as possible and overheating must be avoided (maximum melting temperature 740°C). Iron tools that may be touched by the liquid metal must be specially painted to avoid spoiling the alloy. The best alloy purification results are achieved by treating the alloy with inert gases, such as nitrogen and/or argon, to remove dissolved hydrogen and any oxides in the liquid bath. A careful skimming of the bath is recommended. It is allowed to recycle sprues and casting appendages up to 40% out of the total charge weight.

Heat Treatment - Alloy not to be treated.

FURTHER FEATURES OF THE ALLOY

Resistance to weathering and seawater - Limited resistance to weathering; not suitable for applications directly touched by seawater.

Notes - Castability is excellent and makes it possible to use it a lot. The higher the content of Mg is, the more this alloy tends to hot tearing, even if this tendency is not well-defined. A refining treatment with TiB refiners is recommended to achieve compact components, while a modification treatment with Sodium (Na) or Strontium (Sr) is necessary to increase deformability.

USUAL APPLICATIONS

This alloy is generally used in mechanical engineering, and when high mechanical properties are not necessary. This alloy **does not comply** with standard **EN 601**.
